摘要

In order to improve the devastating physical environment, many townscape innovation projects were implemented in Taiwan. However, even many hardware and software construction plans had been executed continually, the ecological environment continued deteriorating and the characters of local communities kept vanishing. This study aims (1) to investigate the primary problem and predicament while performing the concept of eco-community, and (2) to consider, through appropriately designed professional courses, how landscape students could be trained to help the communities to promote their environmental education and quality. This research tries to propose a planning concept of eco-community as well as an implementing procedure which can accommodate the existing environmental situation and the mechanisms in both the public and private departments. Experience sharing from those cases which had been accomplished by the Department of Landscape Architecture in Chung Hua University was also included in this research.
