摘要

Natural gas is a major source of electricity generated by use of gas turbines or steam turbines. The natural gas enterprise was one of the most dangerous businesses that jeopardous explosions caused by natural gas leaks happen seriously many times each year in public security accident. Individual houses, small-business firms and other constructs are most frequently influenced when an internal penetrate filled gas up within the construct. Management studies and synthesized reference review found that organizational safety climate acquired workers consensus within an organization could diminish accident rates to provide work safety in the natural gas business environment. This research determines what priority criteria from some expertise in the gas industry by analytic hierarchy process method that explores two facets and five constructs for each respectively to determine how organizational safety climate impact work safety for natural gas business.
