Abstract

The recent advancement of wireless sensor network technologies and practices is one of the major roles to the evolution and enrichment of human life and fun with the advent of the next generation convergence network environments. A variety of usages and paradigms for wireless sensor networks is a growing interest in the design, development and deployment of sensor systems for applications with other emerging technologies such as RFID Technology, Multimedia Based Surveillance System, Biomedical Technology, Mobile Agent based Networks, P2P technology and Business Process, etc. In addition, the next evolutionary step for wireless sensor networks is to consider mobility, energy harvesting, and converged and fused services and applications.
