摘要

We present a mobile projection device that can project a large image that is not restricted to a small screen size and can connect to other mobile devices via wireless or a cloud. This allows the sharing of information regardless of location and allows a large screen viewing experience anywhere, anytime. This mobile projection device can be used for entertainment or various other purposes. The cordless projector - Koala, is an implementation of the concept, using a computer and projector pair capable of wireless video and allows a seamless experience where the picture can be projected wirelessly. Koala is small, bright and allows more freedom without the display cable restriction.
